

# The fundamental identity for iterated spherical means and the inversion formula for diffraction tomography and inverse scattering

G. Beylkin

*Courant Institute of Mathematical Sciences,<sup>a)</sup> New York University, 251 Mercer Street, New York, New York 10012*

*(Received 21 September 1982; accepted for publication 22 December 1982)*

$$M_y(0, k, k) = (8\pi^n \omega_{n-1} / k^{2n-4} \omega_n^2) F(y). \quad (7)$$

Also, from the definition (2) of the iterated spherical

In the case of inverse scattering the function  $F(y)$  defined by (6) is the low-pass-filtered version of the so called interatomic distance function<sup>4</sup>
